

1    **ABSTRACT OF THE DISCLOSURE**

2            An adjustable garment rod includes a mounting bracket, an inner  
3    housing, a resilient element and a suspension arm. The mounting bracket has an  
4    arm slot and a first toothed ratchet surface and second toothed ratchet surface  
5    formed alongside the arm slot. The inner housing is mounted pivotally in the arm  
6    slot and holds the suspension arm. The suspension arm extends out of the arm  
7    slot and has two toothed protrusions. The resilient element presses the  
8    suspension arm so that the toothed protrusions engage the toothed ratchet  
9    surfaces to hold firmly the suspension arm at a given angular position. Further,  
10   the garment rod uses several simple parts so that assembling the garment rod is  
11   easy and quick, which saves costs and time.
